DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(c), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(c) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 08/18/2008 has been entered.

Allowable Subject Matter

Claims 1-4, 7-15, 18-22, 32-35 are allowed.

The following is an examiner's statement of reasons for allowance:

The independent claims of the present application disclose a wireless communication system comprising a reselection unit operative to provide an indication to perform cell reselection from a first base station to a second base station; a control unit operative to initiate a cell reselection procedure for the second base station in response to the indication from the reselection unit, wherein the first base station is a current serving cell and the cell reselection procedure selects the second base station as a new serving cell; and a monitoring unit operative to receive from a broadcast channel of the second base station sufficient system information to process a paging channel of the second base station, to determine which particular time intervals are assigned to the device for the paging channel based on the sufficient system information, to start monitoring the paging channel upon reception of the sufficient system information from the

second base station and prior to completion of the cell reselection procedure, and to monitor the paging channel during the time intervals assigned to the device to detect for paging messages sent by the second base station to the device; whereby the device performs an early camping operation which reduces a time gap for receiving paging messages from the second base station during cell reselection; wherein the sufficient system information is System Information Type 3 in a Global System for Mobile Communications (GSM) system.

None of the cited references, i.e., Wiley, Lee, and Wang with Alvesalo and Persson, either alone or in combination discloses a system wherein a monitoring unit operative to receive from a broadcast channel of the second base station sufficient system information to process a paging channel of the second base station, to determine which particular time intervals are assigned to the device for the paging channel based on the sufficient system information, to start monitoring the paging channel upon reception of the sufficient system information from the second base station and prior to completion of the cell reselection procedure, and to monitor the paging channel during the time intervals assigned to the device to detect for paging messages sent by the second base station to the device; whereby the device performs an early camping operation which reduces a time gap for receiving paging messages from the second base station during cell reselection.

During an updated/additional search, various references were found. The closest related reference, Putcha et al., US 20050148349, describes a system wherein if at a selected cell is the same as the cell camped on previously, the wireless communications device is configured for the

paging channel of the previously camped on cell using system information previously obtained previously. According to this aspect of the disclosure, the wireless communications device does not wait to obtain system information for the selected cell before configuring the paging channel. Instead, the wireless communications device is configured for the paging channel of the cell camped on previously using paging channel configuration information already stored previously on the device. Configuring for the paging channel of the cell last camped eliminates delay required for the wireless communications device to obtain the paging configuration information from the system information, which is usually broadcast over a periodic time interval. By configuring the paging channel immediately using paging channel configuration information for the cell camped on previously, without first obtaining system information for the selected cell, the wireless communication device can begin monitoring the paging channel relatively quickly, thereby reducing the likelihood that it will miss a page on the paging channel while configuring or updating the paging channel of the newly selected cell.

Putcha et al., however, is not prior art since Putcha et al. was filed on December 19, 2003, which is after the filing date of the present application.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
